AI Tools & Mini Project: Action Plan

A practical plan for exploring AI tools, applying them to coding, research and productivity, building a mini project, and sharing the journey on LinkedIn.

1. Explore AI tools

Spend an hour or two trying the same task in ChatGPT, Gemini, and Microsoft Copilot (for example, "explain this code" or "summarize this article"). Note how they differ in accuracy, speed, tone, and how well they handle follow-ups. A simple comparison table of strengths and weaknesses makes a good write-up.

2. Use AI for coding, research, and productivity

- **Coding:** generate boilerplate, debug an error, ask for code explanations, write unit tests.
- **Research:** summarize papers, compare technologies, or have it explain a concept at different levels.
- **Productivity:** draft emails, plan a study schedule, turn notes into structured summaries.

Keep a short log of what worked and what didn't, because AI makes mistakes and this log will feed your LinkedIn post.

3. Mini project ideas

Pick one that fits your skill level:

- **AI study buddy:** paste notes, get a summary and a quiz.
- **Resume or cover letter helper:** input a job description and your resume, get tailored suggestions.
- **Text summarizer or sentiment analyzer:** a small web app that calls an AI API.
- **Chatbot for a specific topic:** for example, a college FAQ bot.
- **Upgrade a previous project:** add an AI feature such as smart search, auto-generated descriptions, or a chat assistant.

A simple stack is Python with Streamlit or Flask, or plain HTML/JS, calling an LLM API.

4. LinkedIn post (draft to adapt)

> This week I explored AI tools like ChatGPT, Gemini, and Copilot, and built a mini project: **[project name]**, which [one-line description].
>
> What I learned:
>
> - AI speeds up debugging and boilerplate, but you still need to understand the code.
> - Clear, specific prompts make a huge difference in output quality.
> - Always verify AI answers. It can sound confident and still be wrong.
>
> Tech used: [tools/languages]. Next, I want to [next step].
>
> Link to project: [GitHub/demo]
